Application Guide

Introduction

Extended Messaging provides full support for **smart messaging** known from other Nokia phones in Nokia 9210/9290 Communicator.

After installing **Extended Messaging** in your Communicator, you will be able to send, receive or forward **picture messages**, **operator logos**, **CLI icons (group logos)**, **screen savers**, **ringing tones**, **Flash (class 0) SMSes**, **Blinking SMSes** and also **any files via SMS**.
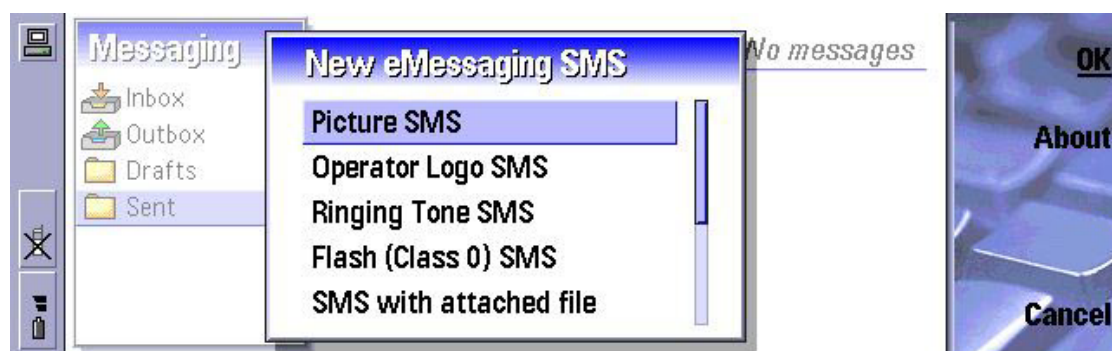

Extended Messaging fully integrates with built-in **Messaging** application, which means that all operations are made within Messaging and there is no need to use any other additional programs.

Sending messages

Simply start **Messaging** application by pressing **Messaging** blue button above the keyboard and then press **Ctrl-N**. You will be presented with a list of message types. Select **eMessaging SMS** from the list and press **OK**.

You will see another list with all smart messaging types supported by **Extended Messaging**. Current version supports following types: **Picture SMS**, **Operator Logo SMS**, **Ringing tone SMS**, **Flash (class 0) SMS, SMS with attached file**, **Blinking SMS**, **Group logo (CLI icon) SMS**, **Special Picture SMS** and **Screen saver SMS.**
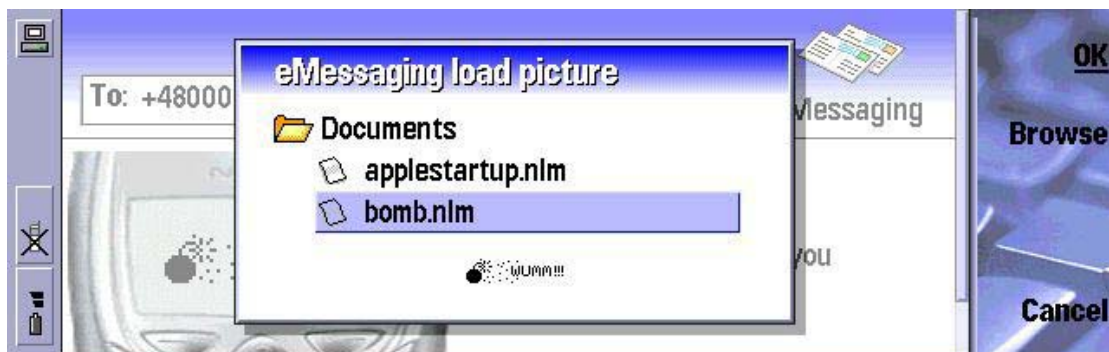

Select your desired message type to proceed to message editor where you can select a picture to be send and type your message.

Picture SMS, Operator Logo, CLI icon, Screen Saver

When you select one of the above message types, you will be presented with a screen looking similar to this below:

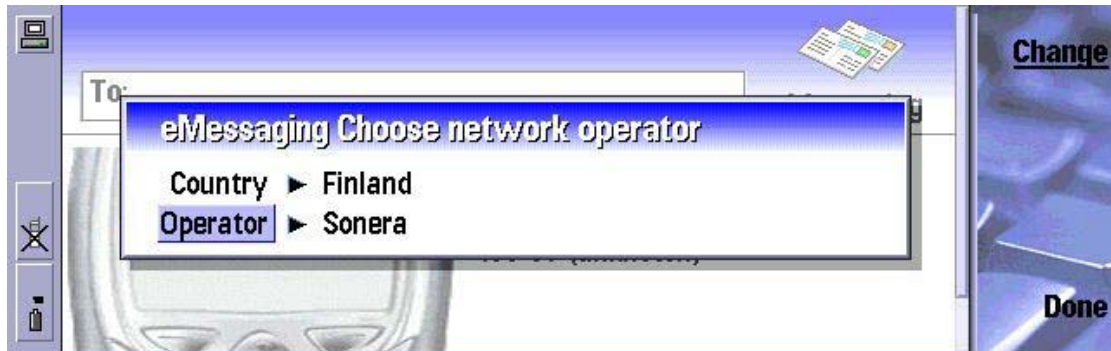

Here you can select a picture to be sent using **Load picture** button. It will open a **picture browser**. Picture browser is equipped with **preview** function to help you locate your desired picture.

Picture SMSes allow sending pictures along with short text message. You can type your text directly in the editor before or after loading the picture.

When sending an **operator logo** one has to provide information about **destination GSM network** (used by the logo recipient). Extended Messaging is equipped with complete **list of all existing GSM networks** so you can easily select proper network by its home country and operator name.

Ringing tone

Extended Messaging supports sending ringing tones via SMS. Press **Load file** to attach ringing tone to your message and select the recipient.

Flash SMS, Blinking SMS

Flash SMS (class 0 SMS) is a special type of short message, which will be immediately displayed on recipient's phone screen. **Blinking SMS** is a message which blinks on recipient's phone display, being a good method of sending important data.

WARNING: Flash messages and blinking messages are supported by selected phone models. If recipient's phone doesn't support flash or blinking messages, they will be shown as normal SMSes.

Special Picture SMS, SMS with attached file

Extended Messaging takes advantage of Nokia Communicator capabilities and introduces two more types of 'special' messages: **Special picture SMS** and **SMS with attached file**.

Special picture SMS allows sending any picuture via SMS, while **SMS with attached file** allows sending **files of any type and any size**. Both these message types can be correctly received only on Nokia Communicator phones and require either full version of **Extended Messaging** or freeware **Extended Messaging Reader** (described below).

For both the above message types simply choose your desired type from the list and press **Load picture** or **Load file** accordingly to attach a picture or file to your SMS.

Extended Messaging Reader (eMessaging Reader)

Some of the message types described above can only be received/displayed on a Communicator equipped with **Extended Messaging**. People who want to receive smart messages sent using Extended Messaging but don't own the full version can use **freeware** application called **Extended Messaging Reader.** eMessaging Reader allows receiving and displaying smart messages sent using full version. It is impossible to **send** messages from the Reader and it also features some other limitations like displaying received pictures with reduced resolution.
