Installation Guide

Installation

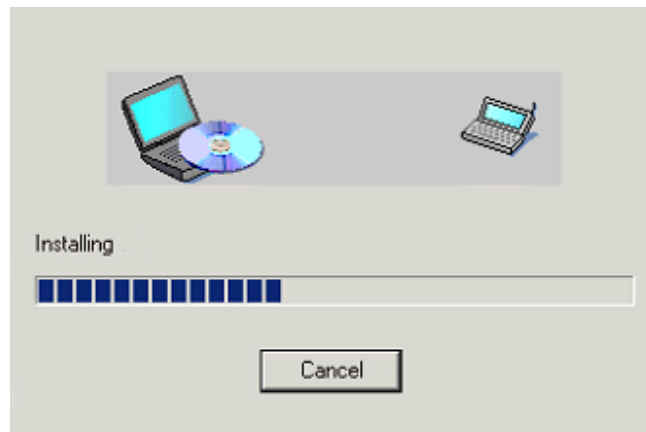

Before installing this version of **Extended Extras** please uninstall any previous versions installed in your machine (if any). In order to uninstall previous version go to **Control Panel** and use **Install/Remove** application by selecting **Extended Extras** from the list and pressing **Remove** button.

Now you can install the newest version. **Extended Extras** package is delivered in form of standard SIS installation file. You have to perform the installation process of this file according to your Nokia Communicator User Manual:

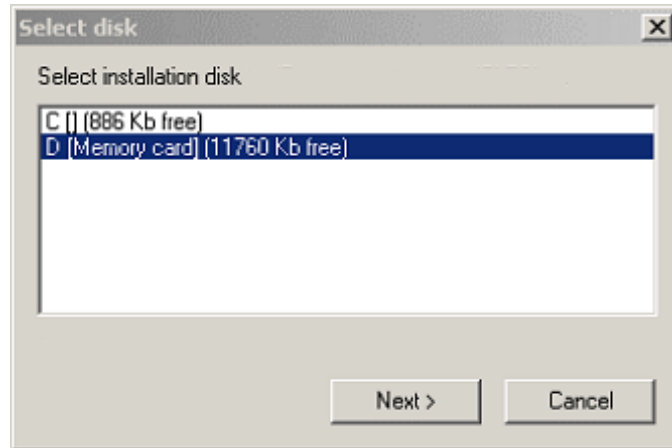

1. Check whether **PC Suite** application is running on your PC. If not – start it.
2. Connect your Nokia Communicator to PC using standard **data cable** (DLR-2L) and wait for PC Suite to establish connection with Communicator

3. Double-click your **SIS** file using left mouse button – this will launch PC Suite's Installer.

4. Select **destination disk** for the installation. Choose **C:** drive (internal memory) if you work with multiple memory cards to assure functionality of the application even if the card is removed/changed or **D:** drive (memory card) if you work with single MMC card to conserve internal memory.

Installation is complete. New, empty folder called **eExtras** is already available in Extras group. Now you can **register** the application by entering **registration code**. If you don't have registration code, Extended Extras application will run in time-limited trial version.
